

ESPOT APP

1. Project Overview

We propose to develop a custom desktop browser application designed to provide secure and reliable IP masking while also including a **management system** for services and users. The browser will combine fast proxy-based browsing with an **Admin Panel** and **User Panel**, making it easy to assign services, manage accounts, and control user access.

The solution will be delivered as an installable desktop app (.exe for Windows; optional .dmg for macOS), giving end users a professional, easy-to-use experience.

2. Key Features

Proxy & Privacy Protections (Core)

- Enterprise-grade proxy integration (SOCKS5/HTTP).
- Complete IP masking – all traffic routed through selected proxies.
- WebRTC & DNS leak protection to prevent exposure.
- Adaptive fingerprint controls (User-Agent, timezone, consistency).
- Integrated diagnostic dashboard to confirm protections.

Admin Panel

- Manage users and assign services/accounts.
- Add accounts and choose which cookies or credentials to share.
- Assign proxies per user to control browsing routes.
- Remove or disconnect any user's device if needed.
- Full branding options with logo, colors, and theme.

User Panel

- Dashboard to view assigned services.
- One-click access with automatic login (via shared cookies or credentials).
- Option to disconnect their own device to switch to another PC.
- Access only the services/accounts assigned by admin.

Device Security

- One active device per user at a time.
- Users must disconnect from PC1 before signing in on PC2.
- Admin override to force disconnect devices when required.

Password Manager Integration

- Credentials for each service stored securely.
 - Auto-fill login so users get instant access without typing passwords.
 - Only the accounts chosen by the admin are shared.
-

3. Tech Stack

- Familiar, professional browser interface (tabs, bookmarks, simple settings).
 - Chromium/Firefox-like UI for easy adoption.
 - Cross-platform installers for Windows (default) and macOS (optional).
 - Secure, lightweight architecture to ensure speed and reliability.
-

4. Deliverables

- Production-ready Windows installer (.exe).
- macOS installer (.dmg).
- Admin Panel for managing users, services, accounts, and proxies.
- User Panel for assigned services and one-click login.

- Diagnostic dashboard for proxy and leak protection verification.
 - 1 week of free support post-delivery for fixes and adjustments.
-

5. Timeline

Estimated Duration: 12–14 weeks

- Week 1–3: Base browser + proxy integration.
 - Week 4–7: Admin Panel & User Panel development.
 - Week 8–9: Leak protection + diagnostics.
 - Week 10–11: Installer packaging & internal testing.
 - Week 11–12: Pilot testing & final delivery.
-

6. Cost & Payment Terms

Total Project Cost: **USD 1800** ($\approx$ PKR 511,804)

Payment Schedule:

- 70% upfront (project kickoff).
 - 30% upon final delivery.
-

7. Notes & Limitations

- This browser significantly reduces detection risk but cannot guarantee 100% invisibility against advanced anti-fraud systems.
- Client will supply proxies.
- Ongoing maintenance and updates (beyond initial support) can be arranged as a separate service.
