

Espot App – Proposal

1. Project Overview

We propose to develop **Espot App**, a custom desktop application that combines the power of proxy-based browsing with **admin control** and a seamless **end-user experience**. The app will look and feel like a standalone software (not like a typical browser) and will run smoothly with no session delays.

The solution will include an **Admin Panel** for management and a **User Panel** for simple access to assigned services.

2. Key Features

Admin Panel Features

- **User & Group Management** – Add, remove, and organize users and groups.
- **Proxy Assignment** – Assign specific proxies to users for secure browsing.
- **Active Session Management** – Control how many devices a user can log in from. Each new device is treated as a separate user unless admin sync is allowed.
- **Credentials Assignment** – Admin assigns login credentials for services; these are automatically filled when users launch a service.
- **Local Data Storage** – Session cookies and caches stored locally on the system for faster performance.

- **Device & IP Recognition** – Each user's device and IP are recognized and can be managed.

End-User Features (User Panel)

- **Seamless App Experience** – Feels like an app, not a browser.
- **Admin-Controlled Search Bar** – Admin decides whether users see a search bar or not.
- Dashboard to view assigned services.
- One-click access with automatic login (via shared cookies or credentials).
- Option to disconnect their own device to switch to another PC.
- Access only the services/accounts assigned by admin. The number of allowed active devices can be more than 1 as per admin choice
- **One-Click Service Access** – Users only see and access the services assigned by admin.
- **Gmail Priority Support** – Gmail accounts will be supported for auto-login.
- **Session Persistence** – Local cookies/cache ensure smooth access without repeated logins.
- The user will have to send 1 message {Start} to the every new number he wants to use. (An autofill message will be integrated on the user end). The Admin will have options to on and off this feature for specific user!

[Any new undiscussed features from now on or during the development will be charged]

3. Important Instructions

- **Credential Sharing Only:** The app will support login through **credentials assignment** (auto-fill login). Other methods of sharing (like full cookie transfers) will not be implemented. Credentials can be displayed or hidden based on the admin's choice . If credentials are hidden, the user will still be able to log in to the website using them, but the credentials themselves will not be visible to the user.
- This app browser will professionally handle the Ring Central, other dialers, as discussed with the Client and the client will give their main services to the developer for testing.
- **Domain Guarantee:** As discussed with the client , We will **not guarantee** whether **dat.com** , **envato elements** works with the app or not. However, other accounts/services provided by the client will be supported and fully functional.

4. Tech Stack

- Familiar, professional browser interface (tabs, bookmarks, simple settings).
- Chromium/Firefox-like UI for easy adoption.
- Cross-platform installers for Windows (default) and macOS (optional).
- Secure, lightweight architecture to ensure speed and reliability.

5. Deliverables

- Windows installer (.exe).

- Optional macOS installer (.dmg).
- Admin Panel with all management features.
- End-User App with assigned services and Gmail support.
- Diagnostic dashboard for proxy, session, and IP checks.
- 18 Days of free support after delivery.

6. Timeline & Payment Terms

Estimated Duration: **12–14 weeks** || Total Project Cost: **USD 1700**

Weeks	Milestone	Deliverables	Payment
Week 1–3	Base App + Proxy Integration	Core app framework with proxy routing	50% upfront
Week 4–6	Leak Protection + Gmail Integration	WebRTC/DNS leak protection + working Gmail login	20%
Week 7–10	Admin Panel + User Panel	Full management system & end-user dashboard	—
Week 10–11	Installer Packaging + Testing	Windows/macOS installers + QA testing	—
Week 11–12	Pilot Testing + Delivery	Final delivery, support & handover	30%

8. Notes & Limitations

- Client will provide proxies.
- Maintenance and updates after delivery will be Charged separately.
